### **Dr. Enno Rodegerdts**

The Nautical Almanac *Daily Pages* and Sun Almanacs found on our site were originally created from PyAlmanac written by the great Norwegian sailor Enno Rodegerdts. PyAlmanac used PyEphem to generate the almanacs and LaTeX provided the final formatting. Visit Dr. Rodegerdts site and learn of his voyages at <https://sv-inua.net/>

Without his work TheNauticalAlmanac.com wouldn't exist.

### **Andrew Bauer**

Mr. Bauer has taken the initial work of Dr. Rodegerdts and improved it to the excellence found in the following Daily Pages. Attending foremost to the accuracy of data and then formatting Mr. Bauer created SkyAlmanac which draws from Brandon Rhodes work *Ephem* and *Skyfield* and provides a clear arrangement of figures required for celestial navigation. To that end his work was determined, tireless and efficient. In our mutual writing across many lines of longitude he has always been pleasant, friendly and most affable.

As he has said, *"The art of celestial navigation should be promoted, not discouraged, even in the modern day"*.

*To both of these men we all owe a large debt of gratitude and thanks*

## **Disclaimer and Warning**

## Celestial Navigation *useful Formulas*

### About Calculators

The Casio *fx-300ES Plus* is an inexpensive calculator at about 11 USD. It features *natural input* so you enter a formula just as it would be written on paper. Entering degrees, minutes and seconds is very simple. The Casio *fx-300ES Plus* has 9 memory locations and you can review many of the previous entries you make using a special key on the calculator.

### Determine Hc using a calculator

#### The formula

$$Hc = \text{asin}[\sin(\text{Declination}) * \sin(\text{Latitude}) + \cos(\text{Latitude}) * \cos(\text{Declination}) * \cos(\text{LHA})]$$

As it would be entered into the Casio calculator Note-  $\text{Sin}^{-1}$  is the arc-sin key

$$\text{Sin}^{-1}(\text{Sin}(\text{Ap Latitude}) \times \text{Sin}(\text{Declination}) + \text{Cos}(\text{Ap Latitude}) \times \text{Cos}(\text{Declination}) \times \text{Cos}(\text{LHA}))$$

**Declination** is the declination of the Celestial body you're observing. When the heavenly body's declination is *Contrary name* to your Ap Latitude enter a negative sign before it.

**Latitude** is the Latitude where you are, think you are or where you would like to determine Hc for. Typically, you'll be using an *Assumed position Latitude* or *Ap Latitude* as it's called.

### In Western Longitudes

**LHA** is the Local Hour Angle which is derived from subtracting your whole number value of Longitude (Assumed or otherwise) from the whole number value of **GHA** (Greenwich Hour Angle).

### In Eastern Longitudes

**LHA**, in **Eastern Longitudes**, is determined by rounding up the GHA figure to the next highest whole degree figure then adding the DR. Longitude to GHA to obtain LHA. Only add the whole degree DR. Longitude figure to the rounded up whole degree GHA figure. If the resulting LHA figure is greater than 360° then subtract 360° from the figure to obtain the LHA.

### Why would you want to determine Hc using a calculator?

It's faster than looking up in Pub. No. 249 and Pub. No. 229, highly accurate and you don't need a lot of printed out pages of Latitudes from Pub. No. 249 and Pub. No. 229. Pub. No. 249 Vol. 2 & 3 don't cover any declination greater than 29 degrees so you'd have to use Pub. No. 229 which is extremely large.

## Celestial Navigation

### **Determine Z**

$$Z = \text{acos}[(\sin(\text{Declination}) - \sin(\text{Ap Latitude}) \times \sin(\text{Hc})) \div (\cos(\text{Ap Latitude}) \times \cos(\text{Hc}))]$$

**As it would be entered into the Casio calculator...** Note-  $\text{Cos}^{-1}$  is the arc-cosine key

$$\text{Cos}^{-1}((\sin(\text{Declination}) - \sin(\text{AP Latitude}) \times \sin(\text{Hc})) \div (\cos(\text{AP Latitude}) \times \cos(\text{Hc}))$$

If the heavenly body's declination is *Contrary name* to the Ap Latitude enter a negative sign before it.

**To obtain Zn see the rules below for Northern and Southern latitudes.**

### **Determine Z independent of Hc**

$$Z = \tan^{-1}\left(\frac{\sin \text{LHA}}{(\cos L \tan d) - (\sin L \cos \text{LHA})}\right)$$

"L" is latitude and "d" is declination. When the heavenly body's declination is *Contrary name* to your Ap Latitude enter a negative sign before it.

**As it would be entered into the Casio calculator...** Note-  $\tan^{-1}$  is the arc-tangent key

$$Z = \tan^{-1} ((\sin (\text{LHA}) \div (\cos(\text{AP latitude}) \times \tan(\text{declination}) - (\sin(\text{AP latitude}) \times \cos(\text{LHA})))$$

The sign convention used in the calculation of this azimuth formula is as follows:

from Bowditch Chapter 22 CALCULATIONS AND CONVERSIONS, page 331

- 1) If latitude and declination are of contrary name, declination is treated as a negative quantity;
- 2) If the local hour angle is greater than  $180^\circ$ , it is treated as a negative quantity. If the azimuth angle as calculated is negative, add  $180^\circ$  to obtain the desired value.

### **To obtain Zn apply the following rules**

<b><u>In Northern Latitudes</u></b>	<b><u>In Southern Latitudes</u></b>
LHA greater than $180^\circ$ ....Zn=Z	LHA greater than $180^\circ$ ....Zn= $180^\circ - Z$
LHA less than $180^\circ$ .....Zn= $360^\circ - Z$	LHA less than $180^\circ$ .....Zn= $180^\circ + Z$

**Determine Refraction**  $0.96 \div \text{Tan of } (H_a)$

Gives good results down to about  $8^\circ$  from the horizon but not less.

**Refraction** (good overall formula from  $90^\circ$  to below  $8^\circ$  from the horizon)

$$R_0 = \cot \left( H_a + \frac{7.31}{H_a + 4.4} \right)$$

## As it would be entered into the Casio calculator...

$$1 \div \tan((H_a + (7.31 \div (H_a + 4.4)))$$

Both refraction formulas use the standard pressure and temperature of;

1010 mb    10° C  
29.83 in    53° F

### Determine Dip using feet

0.97 x (Square Root of *He* (Height of Eye) in feet)

### Determine Dip using meters

1.76 x (Square Root of *He* (Height of eye) in meters)

## Rules to Calculate Latitude using the Sun- Noon-Sight

1- Latitude and declination *Same name* but latitude is greater than declination:

$$\text{Latitude} = (90^\circ - H_o) + \text{declination}$$

2- Latitude and declination *Same name* but declination greater than latitude:

$$\text{Latitude} = \text{Declination} - (90^\circ - H_o)$$

3- Latitude and declination *Contrary name*:

$$\text{Latitude} = (90^\circ - H_o) - \text{Declination}$$

## To get AP longitude (needed for plotting the LOP)

### In Western longitudes

Combine the DR Longitude figure with only the minutes (of arc) of the total GHA figure. The Ap  $\lambda$  figure will be used when plotting the LOP on the UPS.

### In Eastern longitudes

In Eastern longitudes the Ap  $\lambda$  is determined as follows;

DR longitude + (0°60' *minus* GHA minutes of arc)

**Example- E 075° + (0°60' - 0° 02')= 75° 58' Ap longitude**

*fair winds...clear skies and following seas*

Here you'll also find Polaris and Scheat. In the Northern Hemisphere Polaris is often used for determination of latitude.</p>												
6	<b>Mer. pass-</b> planet meridian passage time at the Prime Meridian- Greenwich- 0°. Time figure is GMT/UT.

10	<b>d-</b> the daily average change, per hour, in the Sun's declination in minutes of arc.
11	<b>SD-</b> Semi-diameter of the Moon in minutes of arc. Semi-diameter is one half of the angular width of the Moon, as observed on earth.
12	<b>HP-</b> the angle between two lines, one from the center of the Moon to the center of the Earth, the other from the center of the Moon to the edge of the Earth. This angle is about 56', but it changes slightly from day to day as the distance to the Moon changes along its elliptical path around the Earth. <i>Source- starpath.com</i>
13	<b>Sun- Eqn. of Time-</b> Basically the Equation of Time (EoT) is the difference between clock time and time seen on a sundial. This is comparing "clock time", as a mechanical measurement of time, and the sundial being time determined by the position of the Sun at any given moment. The figures listed are for 00 <sup>h</sup> and 12 <sup>h</sup> . Using the EoT you can get fairly accurate determination of when Meridian Passage (Local Apparent Noon) occurs at your position. Unshaded EoT values are subtracted from 12:00 to get Meridian Passage. Shaded EoT values are added to 12:00 to get Meridian Passage. An Equation of Time chart (as a curve) is provided in each almanac on TheNauticalAlmanac.com <b>Example-</b> Meridian Passage on May 30, 2020 equals 12:00 – EoT of 2 minutes 21 seconds MP= 11:57:39 <i>Local Apparent Noon</i> <b>Example-</b> Meridian Passage on August 25, 2020 equals 12:00 + EoT of 1 minute 59 seconds MP= 12:01:59 <i>Local Apparent Noon</i>
14	<b>Sun- Mer. Pass</b> just to the right of the <b>Eqn. of Time</b> is the approximate GMT/UT when the Sun crosses The Prime Meridian (at Greenwich) for that specific date.
15	<b>Moon- Mer. Pass-</b> is the approximate GMT/UT when the Moon crosses The Prime Meridian (at Greenwich) or the 180° line of longitude. <b>Upper</b> means the GMT/UT when the Moon crosses The Prime Meridian (Greenwich). <b>Lower</b> means the GMT/UT when the Moon crosses the 180° line of longitude.
16	<b>Moon- Age-</b> this is the number of days past a new Moon. Typically, there are 29 days in a lunar month. <b>Moon- %-</b> the amount of the Moon's illumination. 100% would be a full moon. 49% would be about ½ of the Moon is illuminated. A 3 day range percentage is provided but only one graphic for the phase.
17* see notes at bottom	<b>(morning) Twilight- Naut.-</b> the approximate GMT/UT when morning Nautical Twilight begins. Nautical twilight is the time when the center of the sun is 12° below the horizon and the horizon is visible enough to be used for marine sextant observations. First locate your approximate Latitude in the <b>Lat.</b> column and then follow across horizontally to the right to find the time.
17* see notes at bottom	<b>(morning) Twilight- Civil-</b> the approximate GMT/UT of morning civil twilight starts when the geometric center of the sun is 6° below the horizon. First locate your approximate Latitude in the <b>Lat.</b> column and then follow across horizontally to the right to find the time.
17* see notes at bottom	<b>Sunrise-</b> the approximate GMT/UT when the Sun is 0° 50' (semi-diameter plus refraction) below the horizon. First locate your approximate Latitude in the <b>Lat.</b> column and then follow across horizontally to the right to find the time.

17* see notes at bottom	<b>Sunset-</b> the approximate GMT/UT when the Sun is 0° 50' (semi-diameter plus refraction) below the horizon. First locate your approximate Latitude in the Lat. column and then follow across horizontally to the right to find the time.
17* see notes at bottom	<b>(evening) Twilight- Civil-</b> the approximate GMT/UT of evening civil twilight that ends when the geometric center of the sun is 6° below the horizon. First locate your approximate Latitude in the <b>Lat.</b> column and then follow across horizontally to the right to find the time.
17* see notes at bottom	<b>(evening) Twilight- Naut.-</b> the approximate GMT/UT of when evening Nautical Twilight ends. Nautical twilight is the time when the center of the sun is 12° below the horizon and the horizon is no longer visible enough to be used for sextant observations. First locate your approximate Latitude in the Lat. column and then follow across horizontally to the right to find the time.
18* see notes at bottom	<b>Moonrise-</b> the approximate GMT/UT when the Moon is about 0° 05' to 0° 10' below the horizon. First locate your approximate Latitude in the Lat. column and then follow across horizontally to the right to find the time under the specific day.
18* see notes at bottom	<b>Moonset-</b> the approximate GMT/UT when the Moon is about 0° 05' to 0° 10' below the horizon. First locate your approximate Latitude in the Lat. column and then follow across horizontally to the right to find the time under the specific day.

\* Note-

☐ means the Sun or Moon remains continuously above the horizon on that day.

–:– can also mean twilight lasts all night

■ means the Sun or Moon remains continuously below the horizon on that day.

–:– means Moon does not rise or set on that day but may have risen or set the previous day or following day.

\* **Note-** Time of Sunrise, Sunset, Moonrise, Moonset and twilight is based on GMT/UT of the event at 0° (Greenwich) and can be considered as approximate LMT (Local Mean Time) with a tolerance of +/- 30 minutes depending on where you are within a time zone.

## MOON CORRECTION TABLE

The correction is in two parts; the first correction is taken from the upper part of the table with argument apparent altitude, and the second from the lower part, with argument HP, in the same column as that from which the first correction was taken. Separate corrections are given in the lower part for lower (L) and upper (U) limbs. All corrections are to be **added** to apparent altitude, *but 30' is to be subtracted from the altitude of the upper limb.*

For corrections for pressure and temperature see page A4.

For bubble sextant observations ignore dip, take the mean of upper and lower limb corrections and subtract 15' from the altitude.

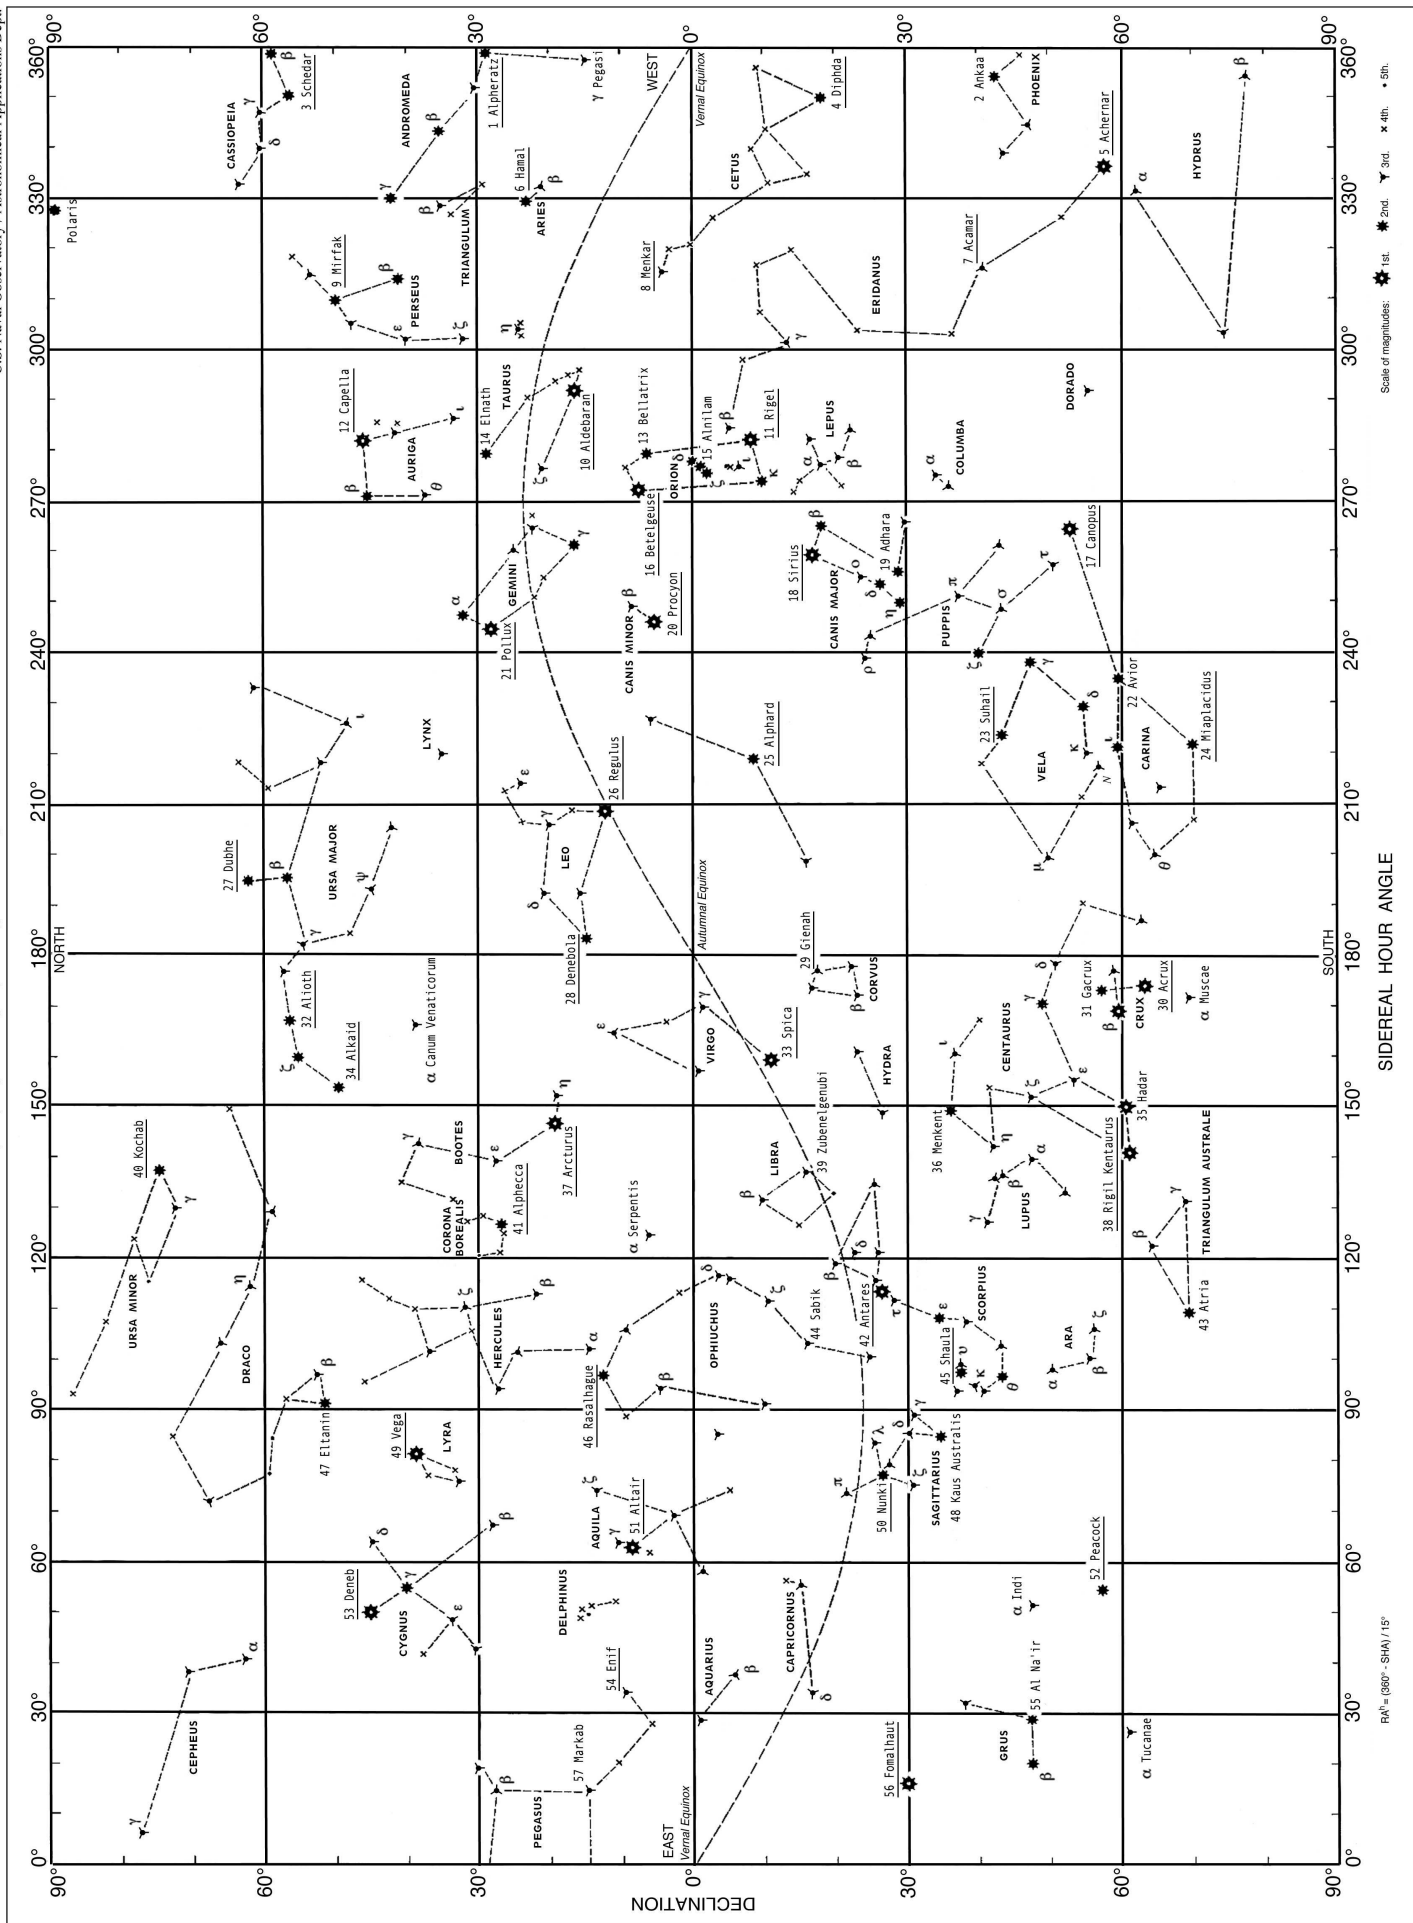

App. Alt. = Apparent altitude = Sextant altitude corrected for index error and dip.
